

Functional Requirements Document

Status: Live | Domain: Event technology and payments | Role: Product Owner and Business Analyst, HunterTV Africa

Purpose

Describes how the solution must behave so each business requirement can be designed, built and tested. Each functional requirement traces to a parent business requirement.

Functional requirements

ID	Parent	System behaviour	Business rule or validation
FR-01	BR-01	Return page verifies payment with the gateway before showing tickets	Gateway confirms paid: order completes; the webhook is a backup, not the only path
FR-02	BR-01	Scheduled reconciliation re-checks orders left pending	Orders for events already past are not auto-completed
FR-03	BR-02	Wallet ledger and withdrawal requests held per currency	Only active events count toward balance; fees shown before withdrawal
FR-04	BR-02	Event currency derived from its paid ticket types	A free ticket never sets the event or cart currency
FR-05	BR-03	Refund handlers for Stripe and Flutterwave webhooks	Invalid signature rejected; refund equals ticket price, not organiser share
FR-06	BR-04	Team invitations with door staff, viewer or manager role	Scan endpoint checks event ownership or active invite
FR-07	BR-05	Ticket send, transfer and organiser swap	Guest purchases link to an account on login by matching email
FR-08	BR-06	Admin dispute-evidence view with PDF export	Includes terms-consent time, reason code and the buyer's prior orders
FR-09	BR-07	Consent banner controls GA4, Meta Pixel and TikTok Pixel	No tracking script loads before consent is recorded
FR-10	BR-08	Rate limits on auth, sanitised rich text and security headers	App refuses to start in production without a JWT secret

User stories

ID	Parent	Story	Acceptance (Given / When / Then)
US-01	BR-01	As a ticket buyer, I want my tickets the moment my payment succeeds, so that I never pay twice because the page said it failed.	Given my card has been charged When I return to the site Then my order shows paid and the tickets are in my inbox
US-02	BR-02	As an organiser selling in naira and pounds, I want to see earnings in each currency separately, so that I know exactly what I can withdraw.	Given an event has sales in GBP When I open my wallet Then the GBP balance is shown on its own, with fees itemised
US-03	BR-04	As an organiser, I want to invite door staff who can only scan my event, so that I do not have to share my login.	Given I invite a person as door staff When they sign in and scan Then they can scan my event and cannot see earnings

Non-functional requirements

Area	Requirement
Reliability	No paid order depends on a single webhook arriving
Security	Secrets in environment variables only; debug endpoints removed; auth rate limited
Performance	Serverless functions run in the same region as the database
Privacy	Tracking only after consent; buyer data visible to the event's own team only

Key data

Field	Type	Allowed values
order_id	Text	Gateway reference plus internal ID
payment_status	Category	Pending, Completed, Failed, Refunded
currency	Category	NGN, GBP, USD, EUR and others enabled
ticket_status	Category	Active, Transferred, Cancelled, Scanned
