

DELIVERED WORK

MyTicketSeller Event Ticketing Platform

From a first API in November 2024 to a live multi-currency ticketing platform with refunds, team access and dispute evidence

Status: Live

Domain: Event technology and payments

Role: Founder, Product Owner and Business Analyst

The problem and what discovery found

Business problem

Organisers selling to Nigerian and diaspora audiences needed to take payment in more than one currency, get paid reliably and control who enters. Early builds were split across separate codebases, payment callbacks were unreliable and revenue was reported in blended currencies.

What the analysis found

1

Buyers saw “payment failed” after a successful charge, retried and were charged twice

2

Foreign-currency sales were mis-converted and blended, so organisers could not trust their earnings

3

Anyone with the organiser login ran the door; scanning was not limited to the organiser's own events

As-Is process

Full-resolution SVG is in the Diagrams folder

MyTicketSeller: As-Is process

Before the rebuild and fixes: payment, delivery and reporting pain points marked.

To-Be process

MyTicketSeller: To-Be process

Live future state, with every decision outcome labelled.

What changed

Area	Before	After
Payments	Tickets depended on one webhook; failures prompted repeat payments	Return-page verification plus reconciliation; tickets arrive near instantly
Revenue	Currencies blended and mis-converted	Per-currency ledger, wallets and payouts with visible fees
Event access	One shared login ran the door	Owner-only scanning with door staff, viewer and manager roles
Protection	Refunds, disputes and secrets handled ad hoc	Verified refund webhooks, evidence PDF, security audit fixes

Delivered outcomes

Figures come from the project's code history; commercial data is not published

4 → 1

separate codebases consolidated into one live platform

90+

owner-led changes shipped in 10 weeks (Jul to Sep 2026)

Recommendations and key risks

Recommended next actions

- Track the share of orders that need reconciliation, per gateway
- Report refund and dispute rates by event and currency
- Compare consented conversion by channel before scaling paid ads
- Keep a written rule for every fee, currency and payout decision

Risks with a named owner

R-01

Payment callbacks arrive late or not at all

Verify on return page and reconcile pending orders

R-02

Currency errors misstate organiser earnings

Per-currency ledger and display rules

R-03

Security gaps left by rapid early builds

Audit: remove debug endpoints, move secrets, rate limit auth

R-04

Chargebacks lost without evidence

Log terms consent and export evidence per dispute
