

TRANSFERABLE ANALYSIS

AI Evaluation Quality and Consistent Judgement

Criteria-based judgement with evidence, version control and calibration

Status: Delivered evaluation work

Domain: Artificial intelligence services

Role: AI Evaluation Contractor

The problem and what discovery found

Business problem

Evaluating AI outputs at scale needs consistent interpretation of criteria, clear separation of evidence from assumption, and safe adaptation when guidance changes.

What the analysis found

1

Criteria can be applied from memory rather than current guidance

2

Evidence and inference get mixed in rationales

3

Guidance updates mid-project cause drift

As-Is process

Full-resolution SVG is in the Diagrams folder

AI Evaluation: As-Is process

Current state before the redesign. Orange activities are the pain points found in discovery.

To-Be process

Full-resolution SVG is in the Diagrams folder

AI Evaluation: To-Be process

Redesigned future state, with every decision outcome labelled.

What changed

Area	Before	After
Criteria	Read once, applied from memory	Active version on every task
Assessment	Overall impression	Each criterion rated separately
Rationale	Short and general	Cites the specific evidence
Ambiguity	Guessed	Escalated to guidance owner

How success will be measured

No live outcomes are claimed for this case

Measure	Current evidence status	How it will be used
Agreement with reviewers	Tracked by the platform	Target stable or rising
Rework after guidance change	Observed	Should fall after calibration
Escalations resolved	Observed	Feed into examples

Recommendations and key risks

Recommended next actions

- Check the guidance version before every batch
- Keep a personal log of edge cases and rulings
- Cite evidence for every negative rating
- Escalate early rather than guess

Risks with a named owner

R-01

Criteria interpreted inconsistently

Worked examples and calibration

R-02

Guidance changes midstream

Version control and change notes

R-03

Unsupported assumption affects rating
